## 1 Objectives

- Expanding the Equivalency Theorem
- Given a singular matrix  $A$ , find all matrices  $b$  such that  $Ax = b$  is consistent

## 2 Theorem

If  $A$  is an  $n \times n$  matrix, then the following statements are equivalent

1.  $A$  is invertible
2.  $Ax = 0$  has only the trivial solution
3. The reduced row-echelon form of  $A$  is  $I_n$
4.  $A$  is expressible as a product of elementary matrices
5.  $Ax = b$  is consistent for each  $n \times 1$  matrix  $b$

6.  $Ax = b$  has exactly one solution for each  $n \times 1$  matrix  $b$

### 3 Theorem

For  $A$  and  $B$  square matrices of the same size, if  $AB$  is invertible, then  $A$  and  $B$  must also be invertible

#### 3.1 Proof

### 4 Problem

If  $A$  is either not square or not invertible, find all  $b$  such that  $Ax = b$  is consistent

If  $A$  is invertible then it has 1 solution. If  $A$  is non-invertible then it either has infinite solutions or no solutions.

#### 4.1 Examples

1. Find all  $b$  such that  $x + 3y = b_1$ ,  $2x + 6y = b_2$  has a solution

$$\begin{bmatrix} 1 & 3 \\ 2 & 6 \end{bmatrix} r_2 - 2r_1 \rightarrow r_2 \begin{bmatrix} 1 & 3 \\ 0 & 0 \end{bmatrix}$$

The last row tells us that  $0x_1 + 0x_2 = b_2 - 2b_1$ , which can only be true if  $b_2 = 2b_1$

So, if  $b_2 - 2b_1 \neq 0$ , then we have no solutions. Thus, we would have solutions when  $b_2 - 2b_1 = 0$

How to write a single column  $b \rightarrow \begin{bmatrix} b_1 \\ 2b_1 \end{bmatrix}$

1. Find all  $b$  such that  $x + 3y + 2z = b_1$ ,  $2x + 7y + 4z = b_2$ ,  $4x + 5y + 8z = b_3$

$$\begin{bmatrix} 1 & 3 & 2 \\ 2 & 7 & 4 \\ 4 & 5 & 8 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 3 & 2 \\ 2 & 7 & 4 \\ 4 & 5 & 8 \end{bmatrix}$$

$$\left[ \begin{array}{ccc|c} 1 & 3 & 2 & b_1 \\ 0 & 1 & 0 & b_2 - 2b_1 \\ 0 & 0 & 0 & b_3 - 4b_1 + 7(b_2 - 2b_1) \end{array} \right]$$

No solution unless  $b_3 - 4b_1 + 7(b_2 - 2b_1) = 0$

Let  $b_1 = t$ ,  $b_2 = s$

$$b_3 - 18t + 7s = 0 \Rightarrow b_3 = 18t - 7s$$

$$\text{Thus, } b = \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix} = \begin{bmatrix} t \\ s \\ 18t - 7s \end{bmatrix} = \begin{bmatrix} t \\ 0 \\ 18t \end{bmatrix} + \begin{bmatrix} 0 \\ s \\ -7s \end{bmatrix} = t \begin{bmatrix} 1 \\ 0 \\ 18 \end{bmatrix} + s \begin{bmatrix} 0 \\ 1 \\ -7 \end{bmatrix}$$

When you add 2 vectors you add component wise, in the above column vector we have 2 variables, so we write in 2 separate column vectors. First entry we have t, so pull it out
